---

# Basic cost models

---

- Fixed Cost
  - ◆ A cost is defined for the whole project
- Time and Materials
  - ◆ A cost is defined for the unit of work
    - E.g. person-hour

# Fixed Cost

---

- Total cost is fixed before project starts
- Requires well-defined
  - ◆ development scope
  - ◆ conditions
  - ◆ timeframes
- No surprises for client
  - ◆ Great for budgeting and accounting
- No flexibility for client
  - ◆ Cannot change their mind

# Time and Materials

---

- Pay developers based on the amount of time they worked
- Does not require detailed upfront knowledge
- Budget must be flexible
  - ◆ Assign an initial budget that can change
- High flexibility
  - ◆ Client can change their mind

# Fixed Cost (developer side)

---

- Can you make it for that amount?
  - ◆ Do you have enough details to estimate?
  - ◆ How much off is your estimate?
  - ◆ What about the “technical” surprises?
- What would be the profit?
- Can you make it by that deadline?
- Are there critical conditions?

# Time and Materials (devs' side)

---

- How much will likely bill overall?
- How many developers will employ?
- How long will it take to implement?
- What would be the margin?

---

# CONTRACT KEY POINTS

# Contract key points

---

- Project scope
  - Delivery cycle
  - Pricing
  - Change control
  - Acceptance
  - Deliverables
  - Termination
  - Warranties and Liabilities
-

# Scope

---

- What is expected from the software developers
  - ◆ Features
  - ◆ Maintenance
- Usually, detailed specification are attached to the contract
  - ◆ E.g., “*Technical annex*”
- How much the scope can change

# Delivery cycle

---

- Milestone for delivering features
- Total cost or budget
- Who is responsible for delays?
  - ◆ E.g.
    - Missing info -> client
    - Late development -> vendor

# Pricing

---

- Total cost or budget
  - ◆ Depends on cost model
- Timing of payments
- How are billed additional development

# Change control

---

- How changes in scope are managed?
- Who approves?
- How to discriminate between
  - ◆ New feature request
  - ◆ Bug fixing

# Acceptance

---

- The definitive ok on the product (or part of)
  - ◆ Usually linked to a payment
- Acceptance testing is the common way
  - ◆ End users can provide feedback
- Can define a set of success metrics
- How much time is allowed?
- If rejected change control takes place

# Deliverables

---

- What exactly is expected
  - ◆ Software
  - ◆ Documentation...
  - ◆ Inventory of third-party code
- Intellectual property
  - ◆ Code ownership
  - ◆ Design

# Warranties and Liabilities

---

- What is warranted by the vendor?
  - ◆ E.g. security issues
- What the vendor can be considered liable for?

---

# AGILE CONTRACTS

# Agile Contracts

---

- Goal: successful project
    - ◆ Not the same as successful contract
  - Foster system thinking
    - ◆ Avoid silo mentality
  - Involved lawyers should understand agile principles
-

# Agile vs. Traditional

---

## Agile

Time: Fixed

Cost: Fixed

Scope: Variable

## Traditional

Time: Variable

Cost: Variable

Scope: Fixed

Quality?

# Key Pillars

---

- Fixed price work packages
- Early termination option
- Flexible changes
- Additional work always possible
- Ranged estimates

# Agile Misunderstandings

---

- FALSE** Agile makes requirements are not known or estimated before start
- E.g. Scrum initial backlog creation identifies and estimates requirements

- FALSE** ■ With Agile requirements must change
- Agile provides instruments to support change, does not mandate it
-

# Project scope

---

- Agile contracts do not define an exact and unchanging project scope
    - ◆ Target–cost contract
      - Scope and details identified as best as possible
      - Mechanisms for change
    - ◆ Progressive contract
      - Scope is defined with one iteration horizon
    - ◆ Maintenance and additional work are implicitly included
-

# Project Vision

---

For *<target customer>*

Who *<statement of the need or opportunity>*

The *<product name>* is a *<product category>*

That *<key benefit, compelling reason to buy>*

Unlike *<primary competitive alternative>*

Our product *<statement of primary differentiation>*

# Delivery cycle

---

- At the end of each timeboxed iteration deliver a deployable system with useful features
  - Key elements
    - ◆ Doneness and deployability
    - ◆ Duration
    - ◆ Timeboxing
-

# Change control

---

- Change is at the heart of agile
  - Changes
    - ◆ Relationship between parties
      - Defined in contract
    - ◆ Project scope
      - Avoid traditional method (e.g. change management board etc.)
      - Different levels of flexibility
-

# Acceptance

---

- Contract should define the framework for acceptance only
  - Acceptance means conformance to
    - ◆ A prior agreed-upon acceptance test suite (automated)
    - ◆ The definition of done
  - Possible involvement of prospective users in the acceptance
-

# Deliverables

---

- Avoid list of deliverables
    - ◆ Distracts focus from working software and waste effort in less useful activities
    - ◆ Attracts focus to conformance rather than collaboration to create useful software
    - ◆ Creates a (false) sense of control
    - ◆ Reinforces the (untrue) belief of predictability
  - Documentation may be useful for maintenance, not earlier
-

# Liabilities and Warranties

---

- Early and frequent delivery mitigate liabilities
    - ◆ Issues get discovered earlier
    - ◆ They get fixed soon
  - Warranties are similar
-

# Termination

---

- Termination is a unique change option
  - The ideal termination model is to allow the customer to stop, without penalty, at the end of any iteration
    - ◆ Early termination should be viewed as a positive, desirable event in an agile project
    - ◆ Typically a sliding scale of penalty to the customer that reduce over time
-

---

# PRICING AND PAYMENT

# Contract models

---

- Fixed-price, fixed-scope (FPFS)
  - Variable-price, variable-scope progressive
    - ◆ Capped-Price, Variable-Scope
    - ◆ Capped-Price, Partial-Fixed-Scope
    - ◆ Fixed-Price, Variable-Scope
  - Shared pain/gain
    - ◆ Target cost
    - ◆ Multi-phase variable model
    - ◆ Profit sharing
-

# Fixed-price, fixed-scope

---

- Optimal for:
    - ◆ Customer to know cost for budgeting
    - ◆ Supplier to book the total order value
    - ◆ Sales person to book and get commission
    - ◆ Manager to order and forget
-

# Fixed-price, fixed-scope

---

- Worst for project success:
    - ◆ Especially when it comes with fixed-time
    - ◆ Typically lead to loss-loss situation
    - ◆ Contingency risk hidden fee (up to 50%)
    - ◆ Lead to **technical debt** accumulation
      - Offshore outsources get a “rent” from change-requests
-

# Fixed-price, fixed-scope

---

- Nevertheless, they are applied
    - ◆ Upfront requirements analysis, estimation, and testing
    - ◆ Added margin to account for risk
    - ◆ Agile improves cost, productivity, quality
    - ◆ Agile let know *how bad things are* as early as possible
  - Payment
    - ◆ Fixed percentage per iteration
    - ◆ Lump sum on completion
-

# Flexibility in FPFS

---

- Replace existing requirements with new ones of equal effort
  - Change order of implementation
    - ◆ I.e., reprioritize
  - Improve “definition of done”
  - Additional releases priced T&M
  - Early termination
    - ◆ Pay 20% of remaining unbilled value
-

# Variable-price, variable-scope

---

- Master service agreement:
    - ◆ Organizations relationships
    - ◆ Pricing scheme per iteration
      - Fixed price per iteration, T&M, etc.
  - Customer exposure is limited
    - ◆ Termination possible at any iteration, with a working system
  - Before each iteration customer and supplier agree on goal
    - ◆ 1 or 2 iterations ahead
-

# Variable-price, variable-scope

---

- Capped-price
    - ◆ Cap upon a pricing scheme, e.g. T&M
  - Non-binding release Backlog
    - ◆ Non-binding allows flexibility
    - ◆ Starting point for common vision
    - ◆ Base for estimating the iteration cap
-

# Flexibility levels

---

- (Price, Scope, Time) can range from
    - ◆ Fixed to
    - ◆ Flexible
  - Examples
    - ◆ Capped–Price, Partial–Fixed–Scope
      - Small subset of requirements fixed
    - ◆ Fixed–Price, Variable Scope
      - With fixed–time becomes optional scope
-

# Pricing Schemes

---

- Lump sum / Fixed Price
  - Time and Materials (T&M)
  - Fixed price per iteration
  - Fixed price per unit of work (UoW)
  - Hybrid (shared pain/gain)
  - Pay per use
-

# Time and Materials

---

- T&M contract fit perfectly agile
  - Iterative nature solves typical issues:
    - ◆ Endless cycle of payments before seeing useful results
    - ◆ Good value for the money?
  - Possible exposure mitigation:
    - ◆ Capped T&M per iteration/project/release
    - ◆ Capped T&M per iteration w/adjustment
-

# Fixed price per iteration

---

- Requirements defined and agreed-upon before the iteration
    - ◆ Like fixed price per project with smaller scope
    - ◆ Supplier must estimate correctly
    - ◆ Supplier adds a contingency fee for risk
  - Highly flexible or no predefined requirements
    - ◆ Customer trust is key
    - ◆ Transparency, frequent delivery
-

# Fixed price per unit of work

---

- UoW == running, tested features
    - ◆ Working software is the primary measure of progress
    - ◆ Measure of features
      - Story points
      - Feature points
      - Use Case points
      - Function points
-

# Fixed prices per UoW – Issues

---

- Feature measurement
  - ◆ Clear and shared framework
  - ◆ Possibly standardized measure
  - ◆ Possibly independently certifiable
    - E.g. Function points
- Business value vs. size points
  - ◆ Loose correlation
  - ◆ Impact estimation

# Determining UoW price

---

- Average based on previous projects
  - Customized amount
    - ♦ A few iterations w/other pricing scheme
      - Average price per UoW
      - T&M
    - ♦ Then agreement on fixed price per point
-

# Risk shifting and sharing

---

- Aligning motivations of both parties
  - Sharing
    - ◆ Both parties have skin in the game
  - Shifting
    - ◆ Risk on the party that is accountable
    - ◆ Requirements–related risks in the hands of customer (what)
    - ◆ Technical–related risks in the hands of the supplier (how)
-

# Target cost

---

- Cost definition
    - ◆ Identify and estimate requirements and change costs (realistic)
    - ◆ Supplier establish the target cost and calculate target profit (e.g. 15%)
    - ◆ Share result with customer
  - Project execution
    - ◆ Actual cost tracking and sharing
    - ◆ Determine adjustment
      - = (ActualCost – TgtCost) \* CustomerShare
    - ◆ Payment = TgtCost + TgtProfit + Adjust
-

# Target cost

---

- Key elements
    - ◆ High transparency and near-real-time, open-book project accounting
    - ◆ Collaboration for continuous improvement
    - ◆ Agreement on guidelines for target-cost adjustment
      - Inherently fuzzy
    - ◆ Test-driven acceptance
-

# Hybrid shared pain/gain

---

- Price is composed of
  - ◆ Price for effort (discounted)
  - ◆ Price per unit of work

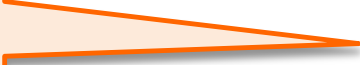

# Hybrid

---

- Fictional case

Estimate	1800 FP
Team	6 FTE
Iteration	2 Weeks

Productivity: 2.5 FP/PD  
Cost: 500 €/PD

Velocity	150 FP/Iteration
Duration	12 Iterations
Effort	720 PD
Cost	360 000 €

- Price

- ◆ 150 €/PD (discounted: 70%)
- ◆ 140 €/FP

Computed to get the PD cost  
in case of correct estimation

---

# Hybrid

70% of extra cost/saving is charged on supplier

# Multi-phase variable model

---

- Projects have a changing risk profile over time
  - ◆ Hopefully with an improving trend
- Multiphase adjust contract type to accommodate such change

# Contract evolution (example)

---

- FPFS per project
    - ◆ Agile exposure is attractive
  - Progressive, T&M with bonus/penalty
    - ◆ Penalty may trigger gaming
  - Progressive, fixed price per unit of work
  - Progressive, capped T&M
    - ◆ Support and maintenance
-

# Risk bounding

---

- Level of trust is a key element
- E.g. with a new supplier:
  - ♦ One year-long, fixed-price, fixed-date, variable-scope
  - ♦ Series of two-months, fixed-price, fixed-date, variable-scope contracts with termination option at each iteration
- A few low-risk contract cycles may build trust
